

Flossing important for children, too

Written by Holyoke Enterprise

Learning to brush their own teeth is a lesson all children must master. Although parents ultimately may have children who become proficient at brushing their own teeth, getting them to floss is generally more difficult.

The National Health and Nutrition Examination Survey from the Centers for Disease Control and Prevention found that 41 percent of children aged 2 to 11 had tooth decay in their first teeth. Dental caries are common among children, likely because they have not become proficient at taking care of their teeth.

Soft, sticky foods are commonplace in young kids' diets, and these can promote decay. Even well-intentioned gummy vitamins can be sources of dental decay. Oftentimes, these foods become lodged between the teeth or on the surface of molars. If left in contact with the teeth for too long, food particles become a source of carbohydrates for oral bacteria, and cavities may appear as a result.
